BERNA WHITEPAPER

A fixed-supply TRC-20 utility token for the BERNA.CHAT AI platform

Version 1.2 | 03 November 2026 | TRON Mainnet

> **Important disclosure:** BERNA is not a USD-backed stablecoin. Its deployed smart contract has no USDT reserve, no redemption right, and no price stabilization mechanism. A trading pool opened at 1 BERNA per 1 USDT does not guarantee that price.

1. Project overview

BERNA is a digital utility token deployed on the TRON Mainnet under the TRC-20 standard. The contract issued **6,000,000,000 BERNA** once at deployment to an administrator-designated wallet. The deployed code has no function to issue more tokens.

BERNA is intended to support the BERNA.CHAT artificial intelligence platform. Possible future use cases include AI service payments, subscriptions, and digital credits. These features depend on future platform integrations; they are not implemented by the token contract itself.

2. Token and contract details

Token name / symbol	BERNA / BERNA
Blockchain / standard	TRON Mainnet / TRC-20
Decimals	6
Initial supply	6,000,000,000 BERNA
Smallest units at launch	6,000,000,000,000,000
Contract address	`TCpXTwEhBuUae5RpVcjPEJnfoEpVZ9LmPe`
Initial administrator wallet	`TBTqM6KJXTvrx7ucmXbMzidwyUNmT5QSV2`
Compiler / optimization	Solidity 0.8.20 / 200 runs
Source license	MIT

3. Smart contract features

- **One-time creation:** No additional minting function is available.
- **Transfers:** Holders may use transfer and transferFrom to move BERNA.
- **Allowances:** Holders can approve spending limits for another address; approvals create third-party security risks.
- **Voluntary burning:** A holder may permanently burn BERNA from their own wallet. Burning reduces the total supply but gives no USDT or other asset in exchange.
- **No special seizure powers:** The contract contains no admin-only burn, freeze, blacklist, pause or upgrade function. The admin address is informational and cannot control another holder's balance.

4. Administration and distribution

The initial supply was assigned to a single administrator wallet. That wallet can transfer or burn the tokens it owns, like any other holder. There is no built-in public voting, partner multi-signature treasury, lockup, or vesting mechanism. Any future distribution plans must be documented separately.

5. Planned utility within BERNA.CHAT

The project may integrate BERNA with AI services, subscriptions, usage-based billing, and digital payments. These are planned applications rather than current guarantees. Application-level payment validation, accounting, customer support, and security controls are required before such services are offered.

6. Trading and liquidity

The token contract does not contain an integrated sale function or an on-chain USDT reserve. The project may establish a separate BERNA/USDT trading pool through a decentralized exchange. An initial deposit of 100 BERNA and 100 USDT sets an opening reserve ratio of 1:1, **not a guaranteed market price**. Trading and withdrawals change pool reserves and market conditions. Thin liquidity can cause significant slippage.

7. Security and transparency

TRONSCAN has displayed the contract source as **Verified (Perfect match)** in the issuer-provided record. Source verification helps the public inspect deployed code. It is **not** an independent security audit. No independent audit report has been provided for this release. Holders should verify contract addresses and avoid granting unlimited token allowances to untrusted apps.

8. Key risks

- **Price risk:** BERNA has no fixed USD value and may lose substantial market value.
- **Liquidity risk:** Exchanges may have limited liquidity or unfavorable prices.
- **Custody concentration:** The administrator initially received the full issued supply.
- **Smart contract and wallet risk:** Bugs, phishing, lost keys, and malicious spending approvals can cause losses.
- **Future integration risk:** Additional bridges, trading interfaces, and platform features require separate reviews.
- **Legal and regulatory risk:** Rules vary across jurisdictions; local legal review is necessary before public commercial activity.
